

WHAT DO YOU KNOW ABOUT
**CHEMICAL
ABORTION?**

 Take The Quiz!

Chemical abortion is a two-drug regimen that ends a pregnancy by starving and expelling the developing human. Not to be confused with the “morning after pill,” chemical abortion pills are taken within 10 weeks of pregnancy and are designed to **end a developing human life.**

CHEMICAL ABORTION

IS NOT SAFE.

Chemical abortion has a history of causing **physical and psychological harm** to women. Chemical abortions can cause ectopic pregnancies, severe infections, incomplete abortions, and the drugs have **killed 22 women** and **hospitalized thousands** more since their legalization.

 Take The Quiz!

HAS SERIOUS RISKS.

Women are four times more likely to experience complications from chemical abortion than surgical abortion, including **hemorrhaging, serious infection** (known as sepsis), and **incomplete abortion**. --
Journal of Obstetrics and Gynecology (2009).

HAS AN ENVIRONMENTAL IMPACT.

Chemical abortion causes women to expel human remains and chemical waste into waterways, yet no environmental study has been conducted on abortion drugs. This is not in compliance with FDA regulation and will have **increasingly dire consequences** as chemical abortion rates continue to rise.

SHOULD NOT BE ON COLLEGE CAMPUSES.
